ABSTRACT

The anaesthetic agents are the drugs which causes anaesthesia-reversible loss sensation. It deals with the property of relieving the pain without eliminating sensation. These drugs are generally administered to facilitate surgery. It can be described by two main classes. General anaesthetic, which causes a reversible loss of consciousness, and local anaesthetics, which causes a reversible loss of sensation for a limited region of the body while maintaining consciousness. Here I explain about the Local anaesthetics agents that prevent transmission of nerve impulses without causing unconsciousness. They act by binding to fast sodium channels from within in an open state.

BACKGROUND: The purpose of this Review article is to summarize the Local anaesthetics agents, general mechanism, structures, therapeutic uses, adverse effects and also explains their properties.

Keywords: Local Anaesthesia, relieving pain, nerve impulses

INTRODUCTION (General)

Cocaine is a naturally occurring compound indigenous to the Andes Mountains, West Indies, and Java. It was the first anaesthetic to be discovered and is the only naturally occurring Local anaesthetic; all others are synthetically derived. Cocaine was introduced into Europe in the 1800s following its isolation from Coca beans. Sigmund Freud, the noted Austrian psychoanalyst, used cocaine on his patients and became addicted through self-experimentation. In the latter half of the 1800s, interest in the drug became widespread, and many of cocaine’s pharmacologic actions and adverse effects were elucidated during this time. In the 1880s, Koller introduced cocaine to the field of ophthalmology, and Hall introduced it to dentistry. Halsted was the first to report the use of cocaine for nerve blocks in the US in 1885 and also became addicted to the drug through self-experimentation. Procaine, the first synthetic derivative of cocaine, was developed in 1904. Lofgren later developed lidocaine, the most widely used cocaine derivative, during World War II in 1943.

GENERAL MECHANISM OF ACTION OF LOCAL ANAESTHETIC:

| **Trade name:** Novacaine  
**Iupac name:** 2-(diethylamino)ethyl4-aminobenzoate.  
**Chemical formula:** C<sub>13</sub>H<sub>20</sub>N<sub>2</sub>O<sub>2</sub>  
**Molecular mass:** 236.31 g/mol.  
**Uses:** used to reduce the pain of intramuscular injection of penicillin, and also used in dentistry.  
**Side effects:** the increase of dopamine and serotonin levels in the brain. It also induces weakening of the myocardium leading to cardiac arrest. |
| **Trade name:** Proparacaine:  
**Iupac name:** 2-(diethylamino)3-amino-4-propoxybenzoate.  
**Chemical formula:** C<sub>16</sub>H<sub>26</sub>N<sub>2</sub>O<sub>3</sub>  
**Molecular mass:** 294.389 g/mol.  
**Indications:** It is indicated for procedures such as tonometry, gonioscopy, removal of foreign bodies, or other similar procedures requiring topical anaesthesia of the cornea and conjunctiva.  
**Side effects:** Papillary dilation, lacrimation, stinging, increased winking, keratitis, descemetitis. |
| **Trade name:** Chloroprocaine:  
**Iupac name:** 2-diethylaminoethyl-4-amino-2-chloro-benzoate  
**Chemical formula:** C<sub>13</sub>H<sub>19</sub>ClN<sub>2</sub>O<sub>2</sub>  
**Molecular mass:** 270.755 g/mol.  
**Uses:** It is a local anesthesia given by injection during surgical procedures and labor and delivery.  
**Side effects:** Same as lidocaine |
| **Trade name:** Butamben:  
**Iupac name:** 2-(diethylamino)ethyl4-amino-2-chloro-benzoate  
**Chemical formula:** C<sub>13</sub>H<sub>20</sub>N<sub>2</sub>O<sub>2</sub>  
**Molecular mass:** 236.31 g/mol.  
**Indications:** It is used in minor skin Wound Pain Medications. Poison ivy. Poison oak. Itching.  
**Side effects:** Allergic reactions. Burning irritation. Tenderness. Swelling blisters. Oozing |

CONCLUSION

Understanding the pharmacology of local anaesthetics enables the anaesthetist to predict the potency, speed of onset, duration of action and safety of a specific drug in a given clinical situation, this maximises the opportunity for safe and effective use of local anaesthesia in a wide variety of contexts. The review here illustrates general mechanism, chemistry and therapeutic uses as well as side effects of the local anaesthetic agents including properties and their usage to the future aspects (anaesthetics) and make aware about the types and benefits of local anaesthetic agents.
