ABSTRACT

In recent years, Ricinus communis Linn. has become a subject of interest because of its beneficial effects on human health. The present ethnopharmacological review was conducted to evaluate the therapeutic properties of Ricinus communis by scientific evidences. It belongs to the family Euphobiaceae which is commonly known as castor. Ricinus communis is found throughout the hotter parts of India. This plant is extensively used in Ayurveda, Unani, Siddha, Homeopathic and Allopathic system of medicine as cathartic. Traditionally this plant is used as laxative, purgative, fertilizer and fungicides etc. whereas the plant possess beneficial effects as antioxidant, antifertility, anti-inflammatory, antimicrobial, CNS stimulant, antidiabetic, insecticidal, larvicidal, antiociceptive, antiasthmatic, antiallerg, immunomodulatory, hepatoprotective, lipolytic, wound healing and central analgesic and many other medicinal properties. The extracts or the isolated compounds of this plant have been found to have potent activity against various ailments. The aim of present article is to explore the pharmacological or medicinal importance of the plant Ricinus communis linn.

Keywords: Ricinus communis, Ethnopharmacology, Phytochemical Constituents.

INTRODUCTION

Erand has been freely used all over India since centuries. In day to day life, it is commonly used as a purgative. The botanical name of erand is Ricinus communis and it belongs to family Euphorbiaceae. [1] The seeds, seed oil, leaves and the roots of erand have great medicinal value. The plant is equally useful, both internally as well as externally. Externally, castor is effectively used in the diseases of vata associated with pain and swellings. Internally, erand is used as a potent drug in treating diseases of vata viz. arthritis, sciatica, facial palsy, paralysis, bodyache, tremors, headache etc.[2] The plant is native of India and cultivated throughout the country in gardens and fields and also grows wild in waste places.

R.communis is a small wooden tree which grows to about 6 meters in height and found in South Africa, India, Brazil, and Russia. Stems of Ricinus communis have Anticancer, Antidiabetic and Antiprotozoal activity.[3] In the Indian system of medicine, the leaf, root and seed oil of this plant have been used for the treatment of inflammation and liver disorders [4], as they have been found to be anti-nociceptive [5], hepatoprotective [6], laxative [7] and diuretic [8].

Morphology

The castor oil plant is a fast-growing, suckering perennial shrub or occasionally a soft wooded small tree up to 6 meter or more, but it is not hardy in nature. This plant was cultivated for leaf and flower colors and for oil production. [9]
Leaves are alternate, curved, cylindrical, purplish petioles, sub peltate, drooping, stipules large, ovate, yellowish, united into a cap enclosing the buds, deciduous, blade 6-8 inches across, palmately cut for three quarters of its depth into 7-11 lanceolate, acute, coarsely serrate segments, smooth blue green, paler beneath, red and shining when young. Flowers are monoeccious, large, arranged on the thick rachis of an oblong, spicate panicle, which is at first terminal but becomes lateral by the growth of an axillary bud beneath it; male flowers shortly stalked, on branched peduncles at the base of the panicle, pedicels articulated about the middle; female flowers sessile, at the upper part; bracts broadly triangular. Fruit is blunt, greenish, deeply-grooved, tricoccus capsule, less than an inch long, with the prominences of the ovary becomes sharp, weak, spreading spines, 3-celled, dehiscing loculicidally and septicidally into 6 valves. Seeds are ovoid, flattened, nearly ⅛ inch long by ¼ broad, smooth, shining, pinkish- grey, prettily mottled with dark brown, caruncle large, subglobular, raphe faintly raised, running down centre of ventral surface, embryo large in axis of the endosperm, cotyledons foliaceous, broadly ovate, with a cordate base, veined.[10] Roots are light in weight almost straight with few rootlets, outer surface dull yellowish brown, nearly smooth but marked with longitudinal wrinkles. [11]

Vernacular names
English : Castor, Castor-oil plant
Hindi : Arand, Arand, Andi, Rend
Sanskrit : Gandharvahasta, Vatari
Gujrat: Erandio, Erando
Assam: Eda, Era
Kanada: Haralu, Oudala, Gida
Malyalam: Avanakku
Marathi: Errand
Bengali: Bherenda [12]

Taxonomical classification
Kingdom: Plantae
Order: Malpighiales
Family: Euphorbiaceae
Sub Family: Acalyphoideae
Tribe: Acalypheae
Sub Tribe: Ricininae
Genus: Ricinus
Species: communis

Benefits of the plant
Castor oil is widely used as a cathartic, and also for lubrication and illumination. The oil as
such or after modification finds extensive applications in industry, particularly in USA. Bulk of the commercial oil is generally processed in a number of ways and then used for different purposes. The treated oil finds use in products like paints, enamels and varnishes, oiled fabrics, linoleum, patent leather, flypaper, typewriting and printing inks, greases and special lubricants, polishes, waxes, cutting, dielectric and condenser oils, softening agent for gelatin in rayon sizing, nitrocellulose-baking finishes, hydraulic brake fluids, urethane foams and rubber substitutes, cosmetics, pharmaceuticals and insecticidal formulations. Oil from the perennial types is used for illumination and lubrication while that from the annual types is preferred for medicinal use. Castor oil is often given orally, alone or with quinine sulphate to induce labour in pregnancy at term. The oil can be used as a vehicle for parenteral administration of steroidal hormones. It is used in the preparation of liquid disinfectants like phenyls. It is an excellent illuminant and has been used in lamps from very early times in India. It is used in soap making. Castor cake is used as manure in India. It is rich in nitrogen and other minerals, and has been found to be suitable as manure for paddy, sugarcane, tobacco etc. Leaves are occasionally fed to cattle. They are reported to increase the yield of milk. The powdered leaves are used for repelling aphids, mosquitos, white flies and rust mites. The insectisidal activity is probably due to the presence of the alkaloid ricinine in them. Expressed juice and aqueous extracts of the leaves were active against mycobacteria and yeast. Leaves are said to use in the form of a poultice or fomentation on sores, boils and swellings. Leaves coated with oil and warmed, are commonly applied over the abdomen to give relief in the flatulence in the children. An infusion of leaves is used for stomachache, and as a lotion for the eye. Pounded leaves are said to give relief in caries, and are applied over guineaworm sores to extract the worm. Fresh juice of leaves is reported to be used as an emetic in the poisoning by narcotics like opium; it is also considered useful in jaundice. Leaves are considered lactagogue and are applied as poultice over the breasts or taken internally in the form of juice. Roots are administered in the form of a decoction for lumbago and allied complaints, in the form of a paste for toothache. Root bark is reported to be a powerful purgative. [13,14,15]

**Phytochemical constituents**
The presences of various phytoconstituents in different parts of *Ricinus communis* Linn have been reported.

**Fatty acid**
Seed oil of castor-plant showed the presence of fatty acid, ricinoleic acid (12-hydroxyoctadec-9-enoic acid). Ricinoleic acid comprises over 84% while other fatty acids present were linoleic (7.3%), oleic (5.5%), palmitic (1.3%), stearic (1.2%) and linolenic (0.5%), respectively. [16]

**Essential oil**
The GC-MS analyses of *R. Communis* essential oil using capillary columns has shown compounds like @-thujone (31.71%), @-pinene (16.88%), camphor (12.92%) and camphene (7.48%). [17]

**Triterpenoid saponin**
The Seeds of *Ricinus communis* showed the presence of Triterpenoid Saponin, 3-O-[β-D-glucoronopyranosyl-(1→ 3)-α-L-rhamnopyranosyl-(1→ 2)β-D-glucopyranosyl]-4α,20α-hydroxy methyl olean-12-ene-28-oic acid. [18]

**Triacylglycerols**
Five types of castor bean seed oil triacylglycerols were identified as triricinolein, RRR (84.1%), diricinoleoylstearoylglycerol, RRS (8.2%), diricinoleoyloleoylglycerol, RRO (5.6%), diricinoleoyllinoleoylglycerol, RRL (1.2%) and
diricinoleoylpalmitoylglycerol, RRP (0.9%) respectively. \[^{[16]}\]

**Flavonoid**
The dried leaves of R. communis showed the presence of six flavones glycosides kaempferol-3-Oβ-D-xylopyranoside, kaempferol-3-O-β-D-glucopyranoside, quercetin-3-O-β-D xylopyranoside, quercetin-3-O-β-D-glucopyranoside, kaempferol-3-O-β-rutinoside and quercetin-3-O-β-rutinoside. \[^{[19]}\] Seed and leaf of R. Communis also showed the presence of flavonoids like prunin 2′-o-para coumaroyl, prunin 6″-o-para coumaroyl. \[^{[20]}\]

**Protein**
Seeds of ricinus communis contain three toxic proteins Ricin A, B and C and one ricinus agglutinin. \[^{[21]}\]

**Steroid**
Entire plant of Ricinus communis showed the presence of steroid Brassicasterol and Campesterol. \[^{[22]}\]

**Anthocyanins**
The stem bark of the castor plant showed the presence of Anthocyanins, cyanidin 3-O-β-xylopyranoside-5-O-β- glucopyranoside (21 %), cyanidin 3-O-β xylopyranoside-5-O-(6″-O- malonyl-β- glucopyranoside) (79 %) and cyanidin 3-O-β-xylopyranoside-5-O-(6″- O-methylmalonate- β-glucopyranoside). \[^{[23]}\]

**Tannins**
The leaf extracts of *Ricinus communis* showed the presence of tannins such as catechin and gallic acid.

**Alkaloid**
Alkaloids are present in the aerial parts of the Ricinus communis. The root of Ricinus communis showed the presence of indole 3 acetic acid and the ricinin (0.55%) and N-Demethylricinin (0.016%). alkaloid present in the leaf of plant. \[^{[19]}\]

<tr>
<td>Antidandruff activity</td>
<td>Leaves / Aqueous, methanolic, chloroform and petroleum ether extract</td>
<td>Anti dandruff assay with DMSO</td>
<td>R. communis leaf extracts has antidandruff effects and due to its potential bioactive compounds. Phytochemical screening of various solvent extracts of R. communis leaves revealed the presence of flavonoids, saponins, tannins, phlobatannins and terpenoids. Methanolic extracts exhibited significant activity (8.20 ± 0.3). Aqueous extracts of the leaves recorded appreciable inhibitory activity (5.74 ± 0.8) when compared with chloroform (1.66 ± 1.2) and petroleum ether extracts. Petroleum ether extract gave a mean zone of inhibition of 0.90 ± 0.3 mm, showing the ineffectiveness of the extract.</td>
<td></td>
</tr>
<tr>
<td>Antidiabetic activity</td>
<td>Root / Ethanolic extract</td>
<td>Alloxan induce diabetes mellitus</td>
<td>Blood glucose concentration of rats administered Ricinus communis reduced from 390.0 to 148.5 or 61.9%. Results from this study have confirmed the hypoglycaemic efficacy of root extract of Ricinus communis in rats.</td>
<td></td>
</tr>
<tr>
<td>Antinociceptive</td>
<td>Leaves / Methanolic extract</td>
<td>Acetic acid induced writhing test, Formalin induced paw licking and Tail immersion method</td>
<td>The results indicated that MRCL exhibited considerable Antinociceptive activity against three classical models of pain in mice at doses of 100, 125 and 150 mg/kg bw. Preliminary phytochemical analysis suggested the presence of saponin, steroids and alkaloids.</td>
<td></td>
</tr>
<tr>
<td>Antiulcer activity</td>
<td>Seed / oil</td>
<td>Rats / Gastric cytoprotection method, aspirin induce gastric mucosal damage, pyloric ligation.</td>
<td>The result of indicate that the higher dose of castor oil 1000mg/kg (UI ; 2.35 ± 0.15) was effective in protecting ulcer. It appears that castor oil possess antiulcerogenic principles like flavonoids tannins and saponins.</td>
<td></td>
</tr>
<tr>
<td>Antimicrobial and Antifungal activity</td>
<td>Leaves / Methanolic, Ethanolic and Water extract</td>
<td>Bacteria and fungi / Agar well diffusion method and agar tube dilution method</td>
<td>Methanolic leaf extracts were found to be more active against Gram positive bacteria as well as Gram negative bacteria than ethanol and aqueous leaf extracts. Methanolic as well as aqueous leaf extracts of Ricinus communis were effective in inhibiting the fungal growth.</td>

**DISCUSSION AND CONCLUSION**

Plants have been used as a source of medicine since the dawn of civilization. These medicines occupied a distinct place in the life right from the primitive period till date and provided information on the use of plants or plant products and products as medicine. The use of medicinal plants in the management of various illnesses is due to their phytochemical constituents and dates back antiquity. It is very essential to have a proper documentation of medicinal plants and to know their potential for the improvement of health and hygiene through an ecofriendly system. Thus, a detailed and systematic ethnomedicinal study is required for identification, cataloguing and documentation of plants, which may provide a meaningful way for the promotion of the traditional knowledge of the herbal medicinal plants.
